O2C Backbone vs the 14 Variants

```
BACKBONE: Lead → Inquiry → Quotation → Sales Order → Availability Check →
Delivery → Goods Issue → Billing → Payment
```

#	VARIANT	WHAT CHANGES VS BACKBONE	BUILD?
1	Standard (MTS)	Uses backbone as-is — produce from forecast, sell from stock	**YES — this IS the backbone**
2	Make-to-Order	Inserts Production Order + Manufacturing right after Sales Order, before Delivery	**YES — real branch point**
3	Configure-to-Order	Same as MTO, adds a "Product Configuration" step before Production	Later — MTO variant
4	Third-Party	Replaces your own Production/Delivery with a Purchase Order to a vendor	Skip
5	Intercompany	Delivery/Billing split across two internal legal entities	Skip
6	Consignment	Different lifecycle entirely (Fill-Up/Issue/Return/Pickup), not O2C-shaped	Skip
7	Cash Sales	Collapses Order+Payment+Delivery into one instant step	Skip
8	Rush Order	Skips Availability Check, jumps straight to Delivery	Skip
9	Returns	Reverse flow — Return Order → Goods Receipt → Credit Memo	Skip
10	Credit/Debit Memo	Pure finance adjustment, no goods movement at all	Skip
11	Subscription	Billing repeats periodically instead of once	Skip
12	Service Sales	"Work Order" replaces physical Delivery/Goods Issue	Skip
13	Project-Based	Billing tied to milestones, not one Delivery event	Skip
14	D2C	Same as backbone, just e-commerce-originated	Same as #1

Recommendation: build the backbone (covers #1 and #14) plus the MTO branch (covers #2, and #3 later) — that's 2 real paths, not 14 separate builds.
